Strategy and management control.

We can help your municipality develop its energy and climate strategy, answer the above questions and carry out regular monitoring.

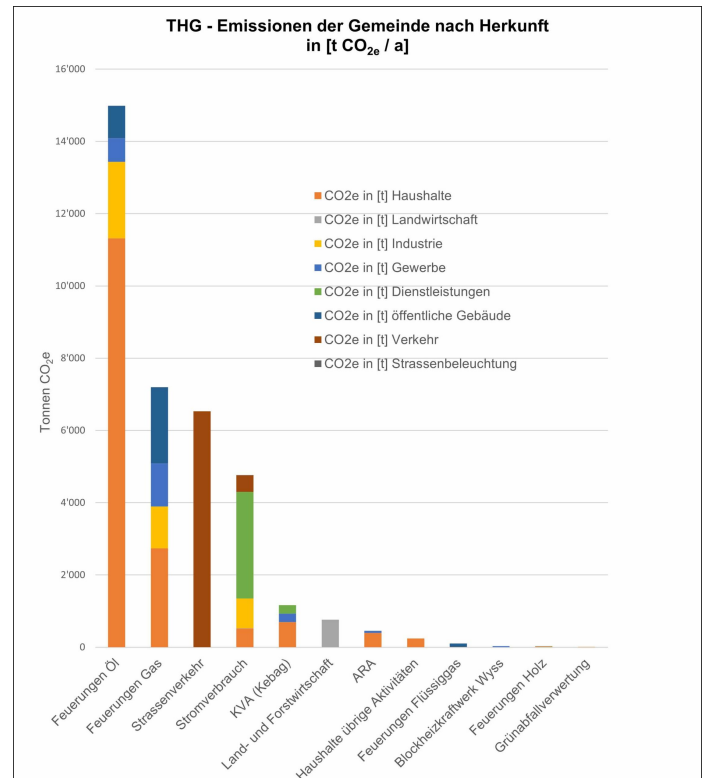

Environmental and energy balancing for municipalities

Energy strategy and energy monitoring

Municipalities have to ensure that the development goals they set are sustainable. These goals often include reducing energy consumption and greenhouse gas emissions to achieve climate neutrality. They can apply not only to specific municipal plants and real estate but also to the entire municipality's operation. However, when it comes to implementing the objectives or, at the latest, developing specific measures, questions arise that are difficult to answer without specialist knowledge and in-depth studies.

Example questions:

- Which are the biggest energy consumers and greenhouse gas emitters?
- Where can our energy efficiency be improved? Where is there potential for renewable energy sources to be used?
- In terms of reduction potential, where should we take action first?
- What is a realistic path to reduction? What reduction goal should we aim for?

Environmental analyses and environmental monitoring for municipalities

- We can investigate existing levels of pollution affecting all aspects of the environment (air, noise, NIR, water and soil pollution), presenting the results in an easy-to-understand, illustrated report.
- We can analyse a municipality's environmental data (fuel, gas, electricity and water consumption, sewage and waste volumes, paper usage, road traffic, etc.) and use this information to calculate the environmental load of the municipal administration and/or the entire municipality.

Energy and greenhouse gas emissions reports

We can analyse energy consumption (gas, oil, electricity) and other municipal data such as sewage and waste volumes, mobility data, etc., and use this and additional activity data, broken down into the different user groups, to calculate the energy consumption and greenhouse gas emissions of the municipal administration and/or the entire municipality.
