Health and safety in the workplace and in domestic settings.

We assist you with measuring and assessing noise and air-pollutant exposure in the workplace and in domestic settings and with developing pollution reduction concepts.

Occupational hygiene & domestic pollutants

And we help you develop concepts to reduce pollution.

Air pollution control in the workplace

Our range of services includes measuring air pollutants in the workplace and assessing the results in accordance with the applicable directives.

We can also advise you on identifying the cause of the pollution and on mitigation measures.

Noise exposure in the workplace

We measure and assess noise exposure in the workplace with respect to the requirements of SUVA and/or Ordinance 3 of the Swiss labour law.

We develop concepts designed to reduce noise pollution in the workplace.

Air pollutants in domestic settings

Modern homes protect us against the cold, wind and rain but also produce emissions that can adversely affect the health and well-being of their occupants: indoor toxins, asbestos, allergens, germs, odours, noise and vibrations.

We will send our experts to your place of residence to measure and analyse these hazards and help you find the appropriate solution.
