We assist you with site contamination and hazardous materials surveys and in developing waste disposal, decontamination and monitoring concepts.

Site contamination & hazardous building materials

Our services:

Contaminated site surveys

We can carry out a historical and/or technical contamination survey of your land (company site, former landfill site) and, where applicable, draw up the necessary decontamination and monitoring measures in accordance with the Swiss Contaminated Sites Ordinance.

Soil testing

We can carry out soil surveys on your site and provide assessments in accordance with the Swiss Soil Pollution Ordinance.

Supervision of excavation work

We supervise excavation work on construction sites with contaminated subsoil.

Hazardous material surveys

We will survey your building for building pollutants and contaminated building structures, providing consulting services on safeguards and decontamination measures.

Risk assessments and remediation supervision

We determine pollutant levels in building structures and subsoil, draw up waste hazard assessments on brownfield sites and provide estimates of site and building value reduction and decontamination costs. Where a building structure is contaminated with asbestos, PCBs, hydrocarbons or other pollutants, we will provide an assessment of health hazards for local residents, select the most effective method of contamination removal, supervise the remediation work and organise the disposal of the contaminated material.
